

Creating a Maven Project in IntelliJ IDEA

RP by Rodrigo Martins Pagliares

Getting Started

Creating a Maven Project in IntelliJ IDEA

1. **New project** → **Project name** (CalculatorMavenProject) → **Location** (Target folder)

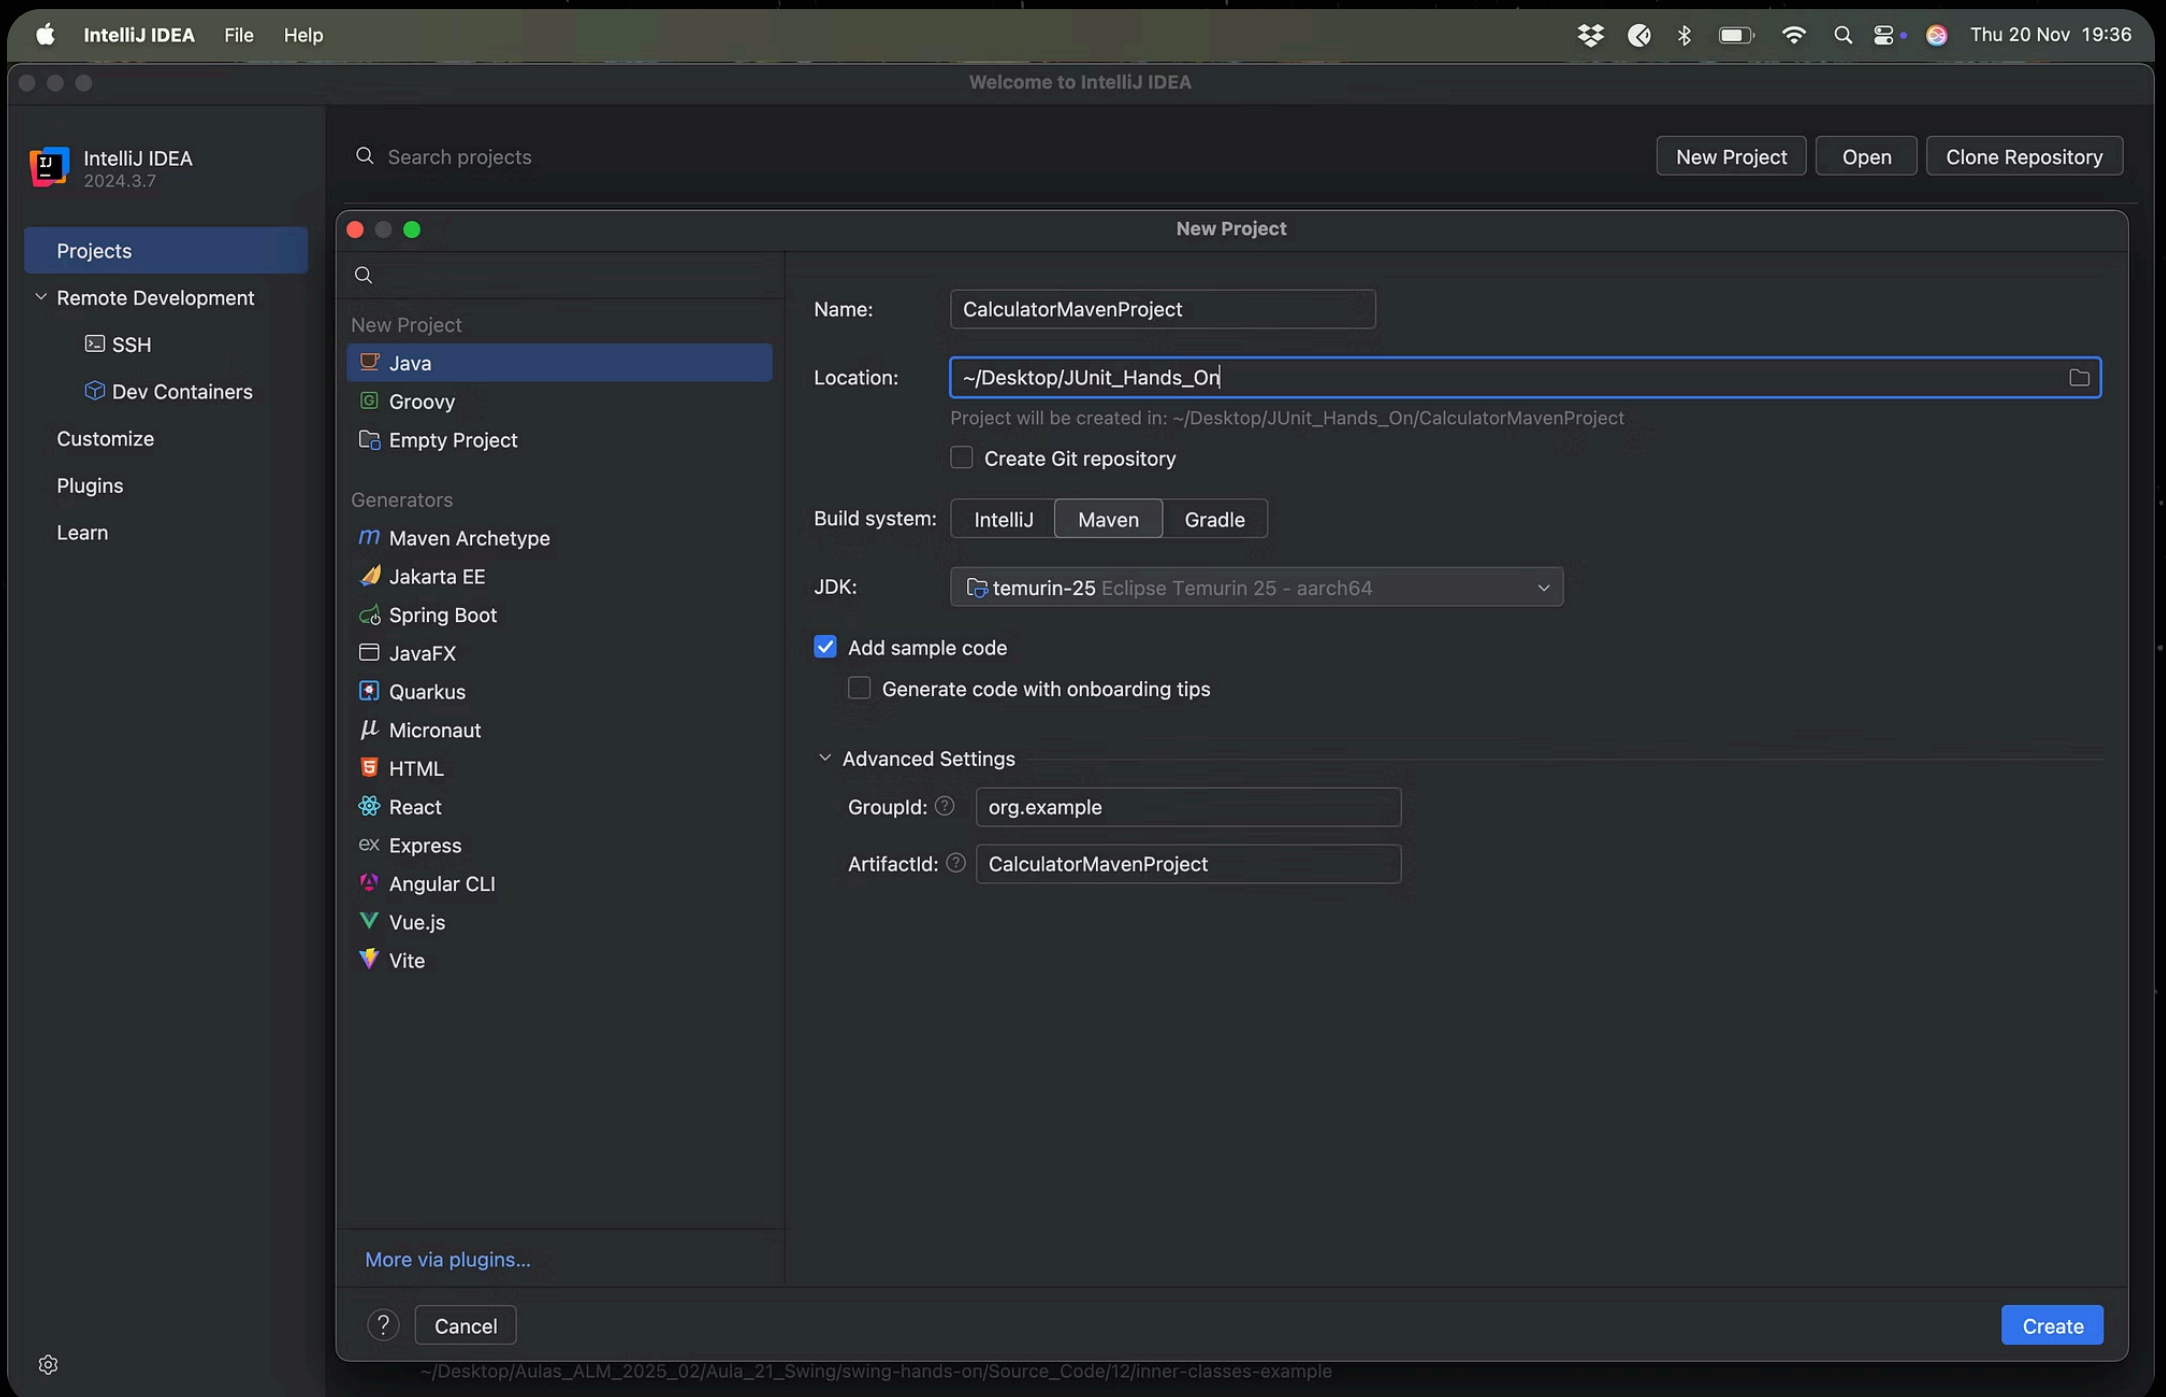

2. **Artifact Coordinates:**

(groupid = org.example, artifactid = CalculatorMavenProject)

3. **Finish** (Generate the **Maven** project structure)

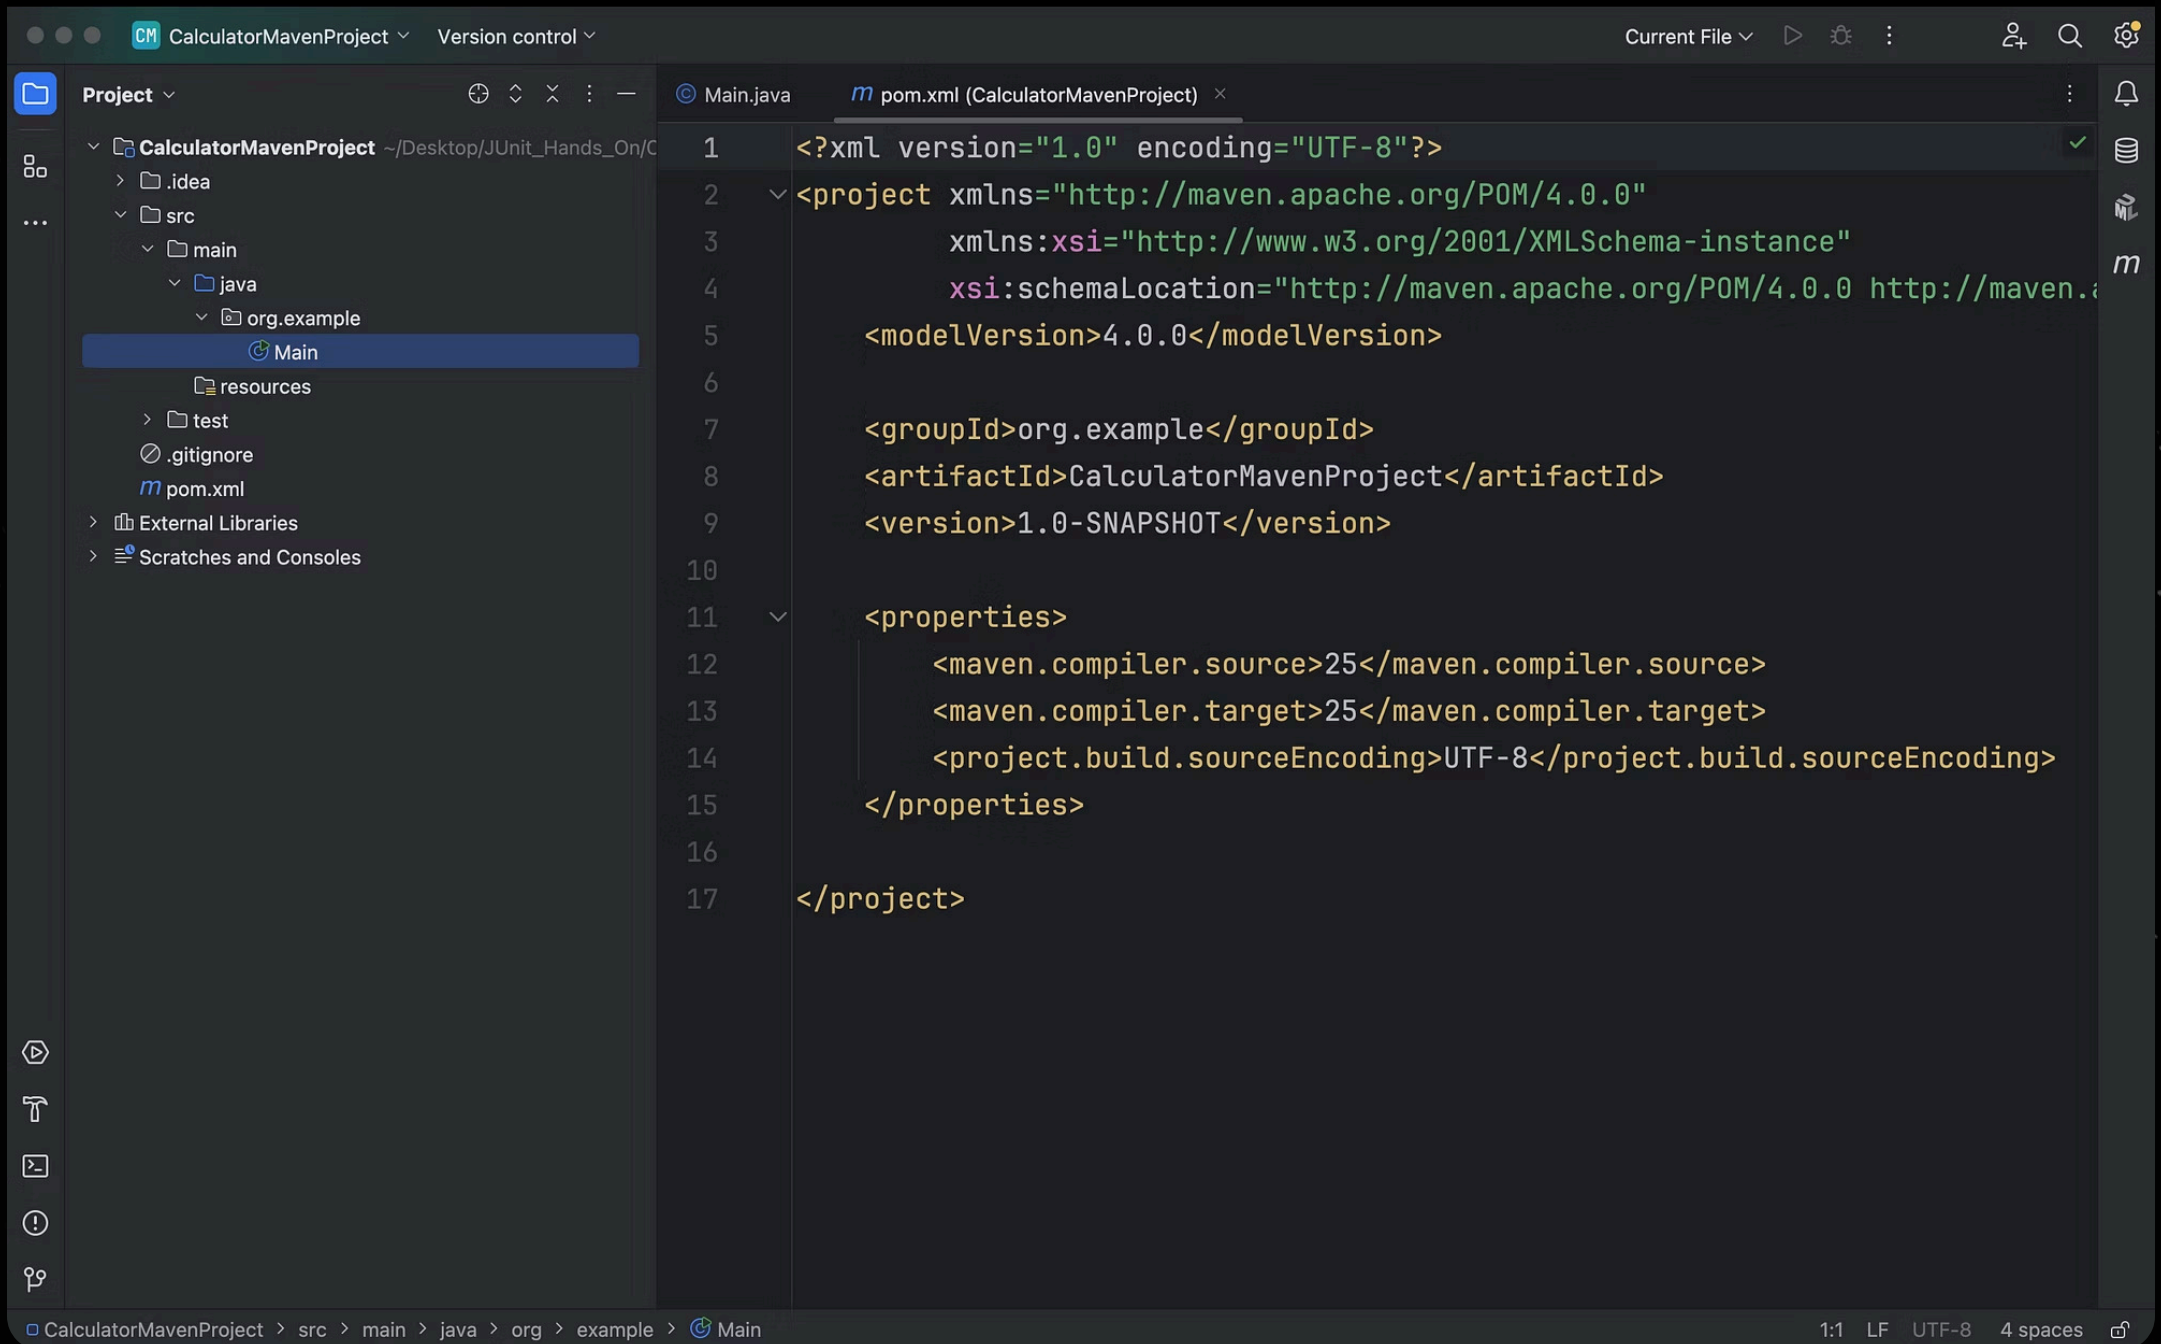

Getting Started

Creating a Maven Project in IntelliJ IDEA

Getting Started

Creating a Maven Project in IntelliJ IDEA

Maven Project Structure Overview

Project Folders

Maven creates **separate folders** for **application** and **test code**

- `src/main/java` for main application classes
- `src/test/java` for test classes

Configuration File

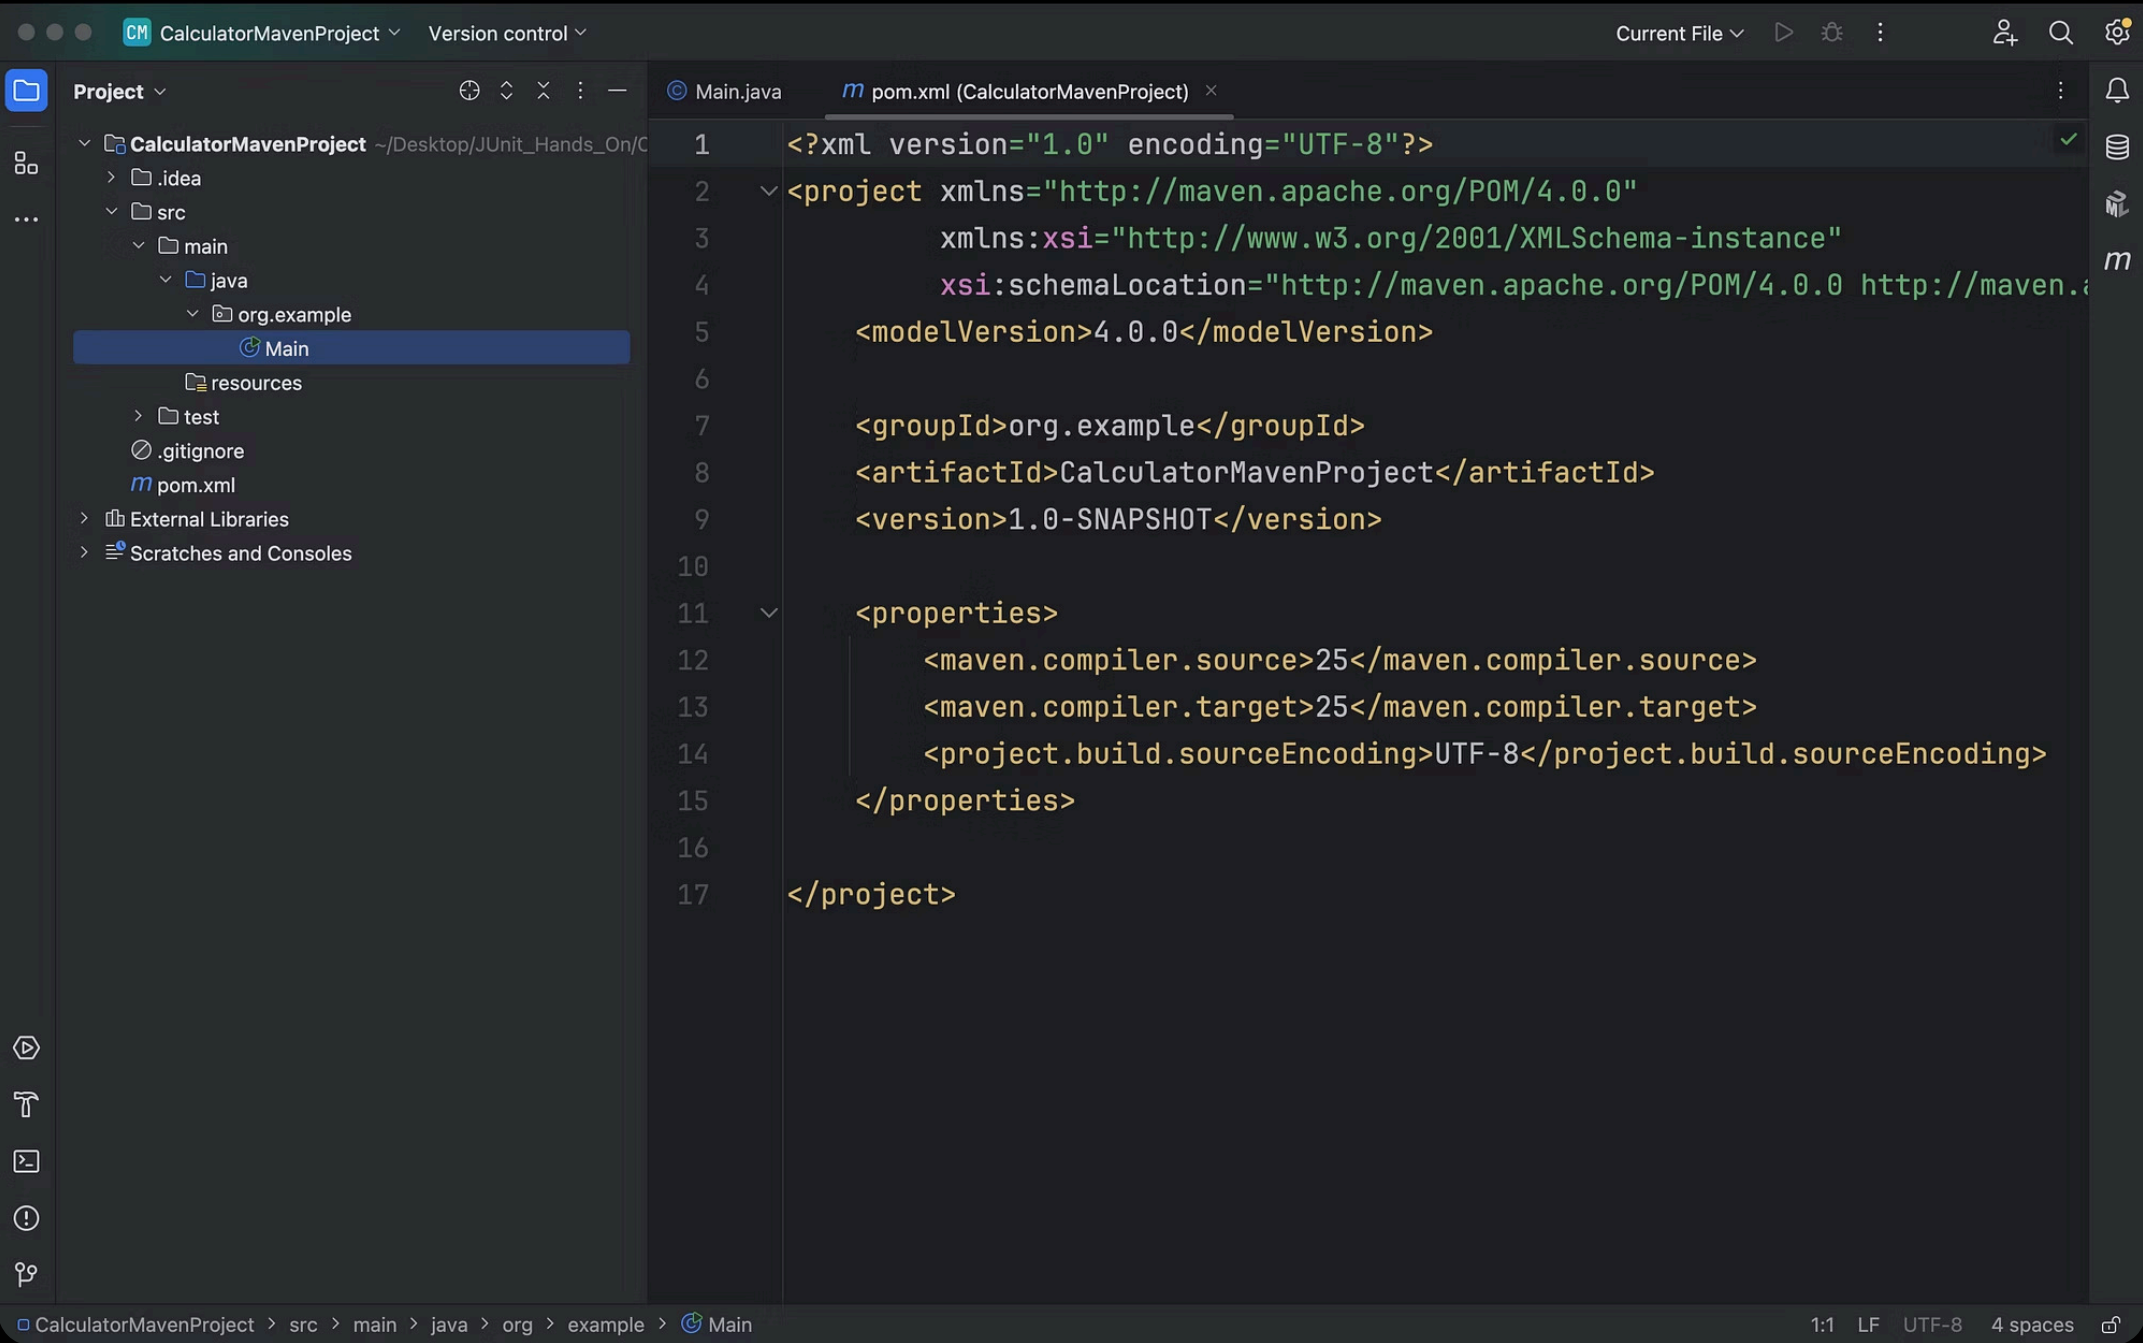

The generated `pom.xml` manages **project dependencies**

JUnit 6 dependencies will be added to this file in the next lesson

Ready to Go

Your project is now ready for configuration and further setup

Conclusion

- **IntelliJ** provides an easy workflow for creating **Java Project** with a **Maven Project Structure**
- **Group ID** and **Artifact ID** uniquely identify the project
- **Maven's folder structure** cleanly separates **source code** and **test code**
- Upcoming lessons focus on **adding JUnit 5** support through the `pom.xml`

Open Floor Discussion

- Have you created **Maven** projects **manually** before, or only via an **IDE**?
- Which folder structure (**Maven** or **plain Java**) do you prefer for new projects?
- Do you usually customize your **Maven coordinates** or **stick with defaults**?
