

Adding JUnit 6 Dependencies to a Maven Project

by Rodrigo Martins Pagliares

Getting Started

Adding JUnit 6 Dependencies to a Maven Project

- JUnit 6 dependencies can be found on mavenrepository.com
- Search for "Jupiter" to locate JUnit 6 components
- Developers may add **dependencies individually** or use an **aggregated one**
- Dependencies must be placed inside the `<dependencies>` section of `pom.xml`
- **IntelliJ** will download required libraries after **Maven** reloads the project

Getting Started

**Adding JUnit 6
dependencies
individually**

Getting Started

Individual JUnit Dependencies

Required JUnit 6 components include:

JUnit Jupiter API

annotations and assertions
for test writing

JUnit Jupiter Engine

implementation of the test
engine

JUnit Jupiter Params

optional support for
parameterized tests

- Each **dependency** can be selected and added separately
- Copy the **XML snippet** from the **Maven** tab and paste into `pom.xml`
- Useful when you want granular control over which modules are included

Getting Started

Adding JUnit 6 Dependencies to a Maven Project

Maven repository → Jupiter (individually) → `<dependencies>` section of `pom.xml` → reload project.

The screenshot shows the Maven Repository search results for the query 'jupiter'. The page is divided into three main sections: Repository, Group, and Category. The Repository section lists various repositories with their respective counts. The Group section lists various groups with their respective counts. The Category section is currently empty. The search results are sorted by Relevance and show 215 results. The top four results are:

- 1. JUnit Jupiter API** (20,619 usages, EPL license). Description: JUnit Jupiter is the API for writing tests using JUnit 5. Last Release on Oct 31, 2025.
- 2. JUnit Jupiter Engine** (19,511 usages, EPL license). Description: Core package for the JUnit Jupiter test engine. Last Release on Oct 31, 2025.
- 3. JUnit Jupiter (Aggregator)** (13,153 usages, EPL license). Description: Module "junit-jupiter" of JUnit. Last Release on Oct 31, 2025.
- 4. JUnit Jupiter Params** (8,372 usages, EPL license). Description: JUnit Jupiter extension for running parameterized tests. Last Release on Oct 31, 2025.

Getting Started

**Adding JUnit 6
dependencies by the
use of an aggregator**

Getting Started

Using the JUnit Jupiter Aggregator

- The **JUnit Jupiter Aggregator** bundles **API**, **Engine**, and **Params** into one dependency
- **Simplifies configuration** by reducing multiple entries to a single XML block
- **Replace individual dependencies** with the **aggregator** if preferred
- Reloading **Maven** applies changes and downloads all **JUnit** libraries
- External **Libraries** panel in **IntelliJ** confirms successful download

Adding JUnit 6 Dependencies to a Maven Project

Contents of file `pom.xml` after including the individual dependencies

The screenshot shows an IDE window for a project named 'CalculatorMavenProject'. The 'pom.xml' file is open, displaying the following XML content:

```
2 <project xmlns="http://maven.apache.org/POM/4.0.0"
17 <dependencies>
19 <dependency>
20 <groupId>org.junit.jupiter</groupId>
21 <artifactId>junit-jupiter-api</artifactId>
22 <version>6.1.0-M1</version>
23 <scope>test</scope>
24 </dependency>
25
26 <!-- https://mvnrepository.com/artifact/org.junit.jupiter/junit-jupiter-engine -->
27 <dependency>
28 <groupId>org.junit.jupiter</groupId>
29 <artifactId>junit-jupiter-engine</artifactId>
30 <version>6.1.0-M1</version>
31 <scope>test</scope>
32 </dependency>
33
34 <!-- https://mvnrepository.com/artifact/org.junit.jupiter/junit-jupiter-params -->
35 <dependency>
36 <groupId>org.junit.jupiter</groupId>
37 <artifactId>junit-jupiter-params</artifactId>
38 <version>6.1.0-M1</version>
39 <scope>test</scope>
40 </dependency>
41 </dependencies>
```

The IDE interface includes a project explorer on the left showing the file structure, a top toolbar with various icons, and a status bar at the bottom indicating the current file, encoding (UTF-8), and line length (4 spaces).

Creating the First Unit Test with JUnit

Getting Started

Creating the First Unit Test with JUnit

01

After dependencies are added, you can immediately create a test class

02

Create a class under `src/test/java`, e.g., `**DemoTest**`

03

Add a simple test method to confirm JUnit functionality

04

Run it using the green play icon; a green checkmark means success

05

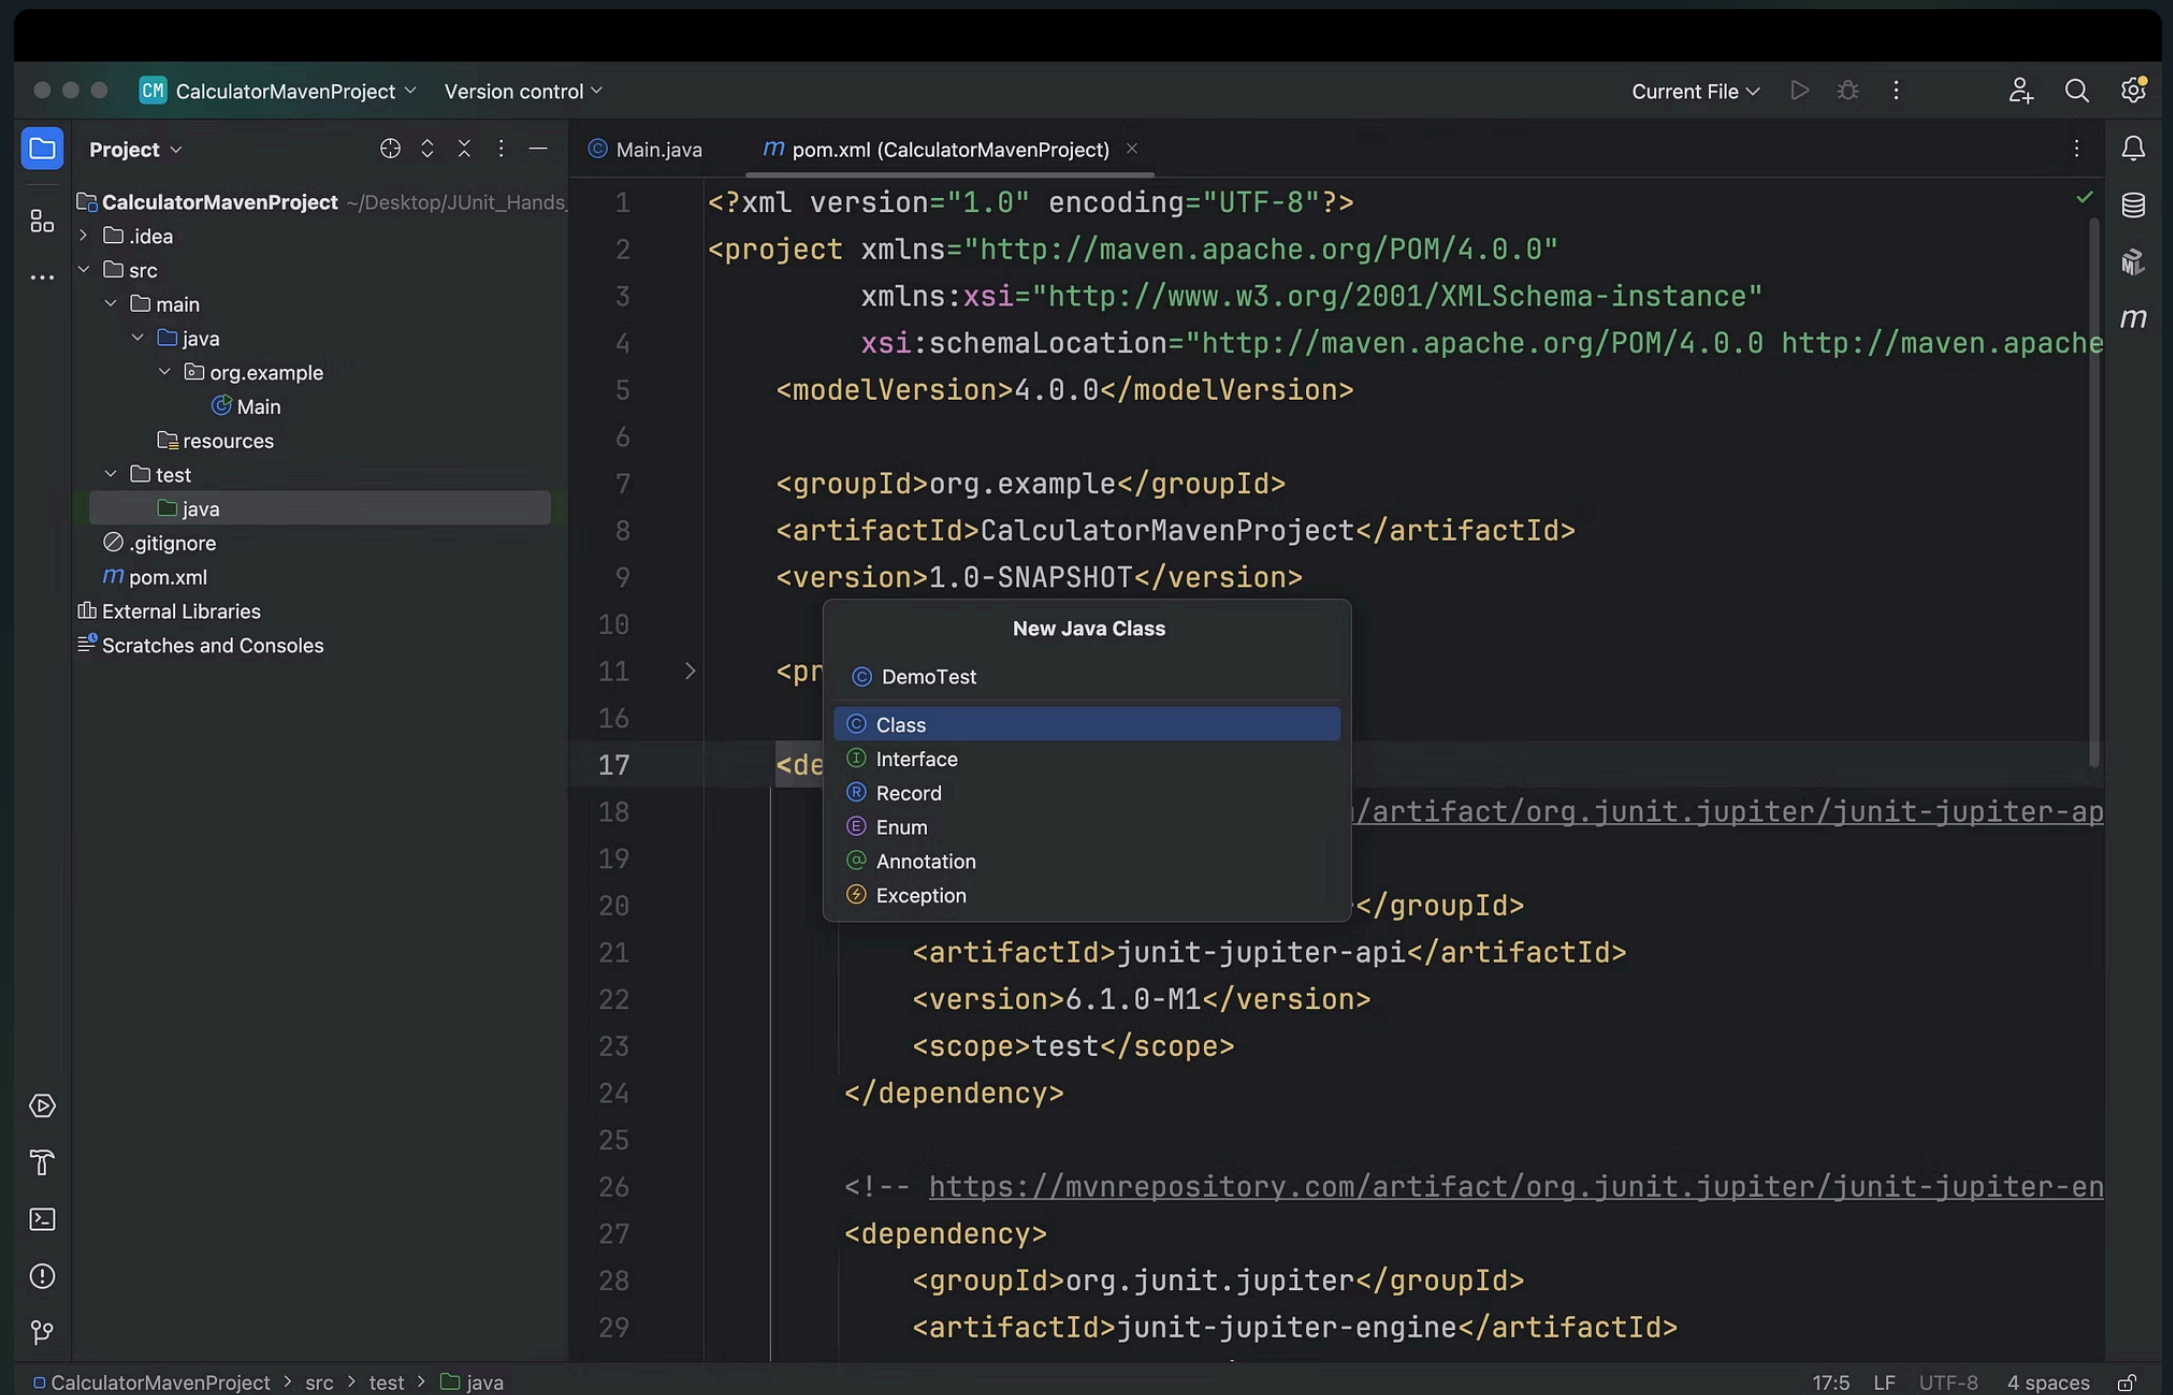

Ensures the environment recognizes and executes JUnit tests correctly

Conclusion

- **JUnit 6 dependencies** can be **added** either **individually** or via an **aggregator**
- **Maven** automatically **downloads** and integrates **required libraries**
- **IntelliJ** provides an intuitive experience for **running** and **validating tests**
- Proper configuration ensures test readiness before deep testing begins

Open Floor Discussion

Do you prefer managing dependencies individually or using the aggregator?

How often do you explore Maven Repository for additional libraries?

Have you experienced issues with IntelliJ not downloading Maven dependencies?
